Semester: **I**

DECLARATION

We hereby declare that the project entitled "**ONLINE QUIZ SYSTEM"** submitted in partial fulfilment of the requirements for the course [**F Com]** is a **record of our original work** carried out under the guidance of **[Moses John Prakash]**, Technical Trainer, Technical Department, KGiSL MicroCollege.

We further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.

We have acknowledged all sources of information used in this project wherever applicable.

ABSTRACT

The Online Quiz System is a web-based application developed to facilitate the efficient conduct of quizzes and assessments through a digital platform. This system provides an interactive environment where users can participate in quizzes, view results instantly, and track their performance over time.

The primary objective of this system is to eliminate the traditional paper-based examination process and provide a fast, secure, and user-friendly alternative. The application allows administrators to create, manage, and update quiz questions, while users can register, log in, and attempt quizzes based on various topics or subjects.

The system ensures accuracy and transparency by automatically evaluating answers and generating results immediately after submission. It also includes features such as time limits, score calculation, and performance analysis. Additionally, the platform maintains a database to store user details, quiz records, and results securely.

Technologies such as web development frameworks, databases, and server-side scripting are used to design and implement the system, ensuring scalability and reliability. The Online Quiz System is useful in educational institutions, training centers, and competitive exam preparation, offering a convenient and efficient method of assessment.

In conclusion, this system enhances the learning experience by providing instant feedback, reducing manual effort, and improving accessibility for both administrators and users.

1. INTRODUCTION

1.1 Objective

- **To develop a user-friendly online quiz platform**
- **To automate the process of conducting quizzes**
- **To provide instant evaluation and results**
- **To store and manage quiz data efficiently**

1.2 Overview

The system allows users to register, log in, and attend quizzes. Administrators can create and manage quizzes, questions, and results. The system automatically evaluates answers and displays scores instantly.

1.3 Features

- **User registration and login**
- **Admin panel for quiz management**
- **Multiple-choice questions (MCQ)**
- **Timer-based quiz system**
- **Automatic result generation**
- **Score tracking and performance analysis**

2. PROGRAM ANALYSIS

2.1 Problem Definition

Traditional quiz systems are time-consuming, require manual correction, and lack efficiency. There is a need for an automated system that can conduct quizzes quickly and accurately.

2.2 Project Overview

Aspect	Description
Language Used	C
Compiler	GCC / Dev-C++ / Turbo C++
Concepts Used	Loops, Functions, Arrays, Conditional Statements,File Handling
I/O Type	Console-based
Optional	File Handling for saving user scores and quiz data

2.3 Scopes and Limitations

Scope:

- Can be used in schools, colleges, and training centers
- Supports multiple users simultaneously
- Accessible from anywhere via the internet

Limitations:

- Requires internet connection
- Limited to objective-type questions (MCQs)
- Security depends on system implementation

3. SYSTEM DESIGN

3.1 Modules

User Module: Registration, login, attempt quiz

Admin Module: Add/edit/delete questions and quizzes

Quiz Module: Displays questions and records answers

Result Module: Calculates and shows scores

Module Name	Description
User Module	This module handles user registration and login functionality. It allows users to create an account, enter credentials, and access the quiz system securely.
Admin Module	This module accepts the customer's choice of items and their quantities. It validates each input, ensuring that the selected item number exists and that the entered quantity is a valid number. It stores each order line for further processing.
Quiz Module	This module computes the subtotal by multiplying the price and quantity for each ordered item. It then calculates the applicable GST (5%) and the final grand total. It ensures accuracy in the billing process by performing all mathematical computations automatically.
Result Module	This module generates a detailed bill format that includes the item name, quantity, price, subtotal, tax, and final total. It presents the bill in a neatly formatted tabular display for the customer.

Module Interaction Overview

1.User Module → handles user registration and login.
2.Admin Module → manages adding, editing, and deleting quiz questions.

3.Quiz Module → displays questions and records user answers.

4.Result Module → calculates and shows the final score.

5.Question Module → stores and retrieves quiz questions.

6.File Storage Module → saves user data and quiz results.

7.Exit Module → ends the program safely.

4. METHODOLOGY

The development of the **Online Quiz System** project follows a structured methodology consisting of five main stages: **Problem Analysis, System Design, Program Development, Testing & Validation, and Results & Documentation**.

4.1. Problem Analysis

In this stage, the existing manual restaurant billing process was studied and analyzed.
The main problems identified were manual calculation errors, time consumption, and lack of digital records. Based on this, clear objectives were defined — such as displaying a digital menu, taking multiple orders, calculating the total automatically, and generating a printed bill. The problem was broken down into smaller tasks to make the program modular and efficient.

4.2. System Design

In this stage, the requirements of the system are carefully studied. The limitations of traditional quiz methods, such as manual evaluation, time consumption, and lack of accuracy, are identified. The need for an automated, fast, and user-friendly system is analyzed. User requirements like login, quiz participation, instant results, and admin controls are also gathered.

4.3. Program Development

In this stage, the actual coding of the system is carried out using appropriate technologies such as:

•Frontend: HTML, CSS, JavaScript

•Backend: Node.js / PHP

•Database: MySQL / MongoDB

Each module is developed separately and then integrated to form the complete system.

4.4. Testing and Validation

The developed system is tested to ensure it works correctly and efficiently. Different types of testing are performed:

•Unit Testing: Testing individual modules

•Integration Testing: Ensuring modules work together

•System Testing: Verifying the complete system

•User Acceptance Testing: Checking usability and performance

Errors and bugs are identified and fixed to improve system reliability.

4.5. Result and Documentation

After successful testing, the system is deployed and results are analyzed. The system provides:

•Instant quiz results

•Accurate score calculation

•Efficient data storage

All stages of development, system design, and results are documented properly for future reference and maintenance.

4.6. Algorithm

1.Start

2.User logs in/registers

3.Select quiz

4.Display questions

5.User selects answers

6.Submit quiz

7.System evaluates answers

8.Display result

9.End

Purpose of the Algorithm

The algorithm designed for the **Online Quiz System** performs the following key tasks in order:

•Start the program and display the system title.

•Display the homepage with options for user login or registration.

•Accept user input for registration or login credentials.

•Validate user details and allow access to the system.

•Display available quizzes or subjects.

•Allow the user to select a quiz.

•Load quiz questions from the database.

•For each question:

    •Display the question along with multiple-choice options.

    •Accept the user's answer.

    •Validate the input.

    •Store the selected answer.

•After answering all questions:

    •Submit the quiz.

    •Compare user answers with correct answers.

    •Calculate the total score.

    •Compute result statistics (correct answers, wrong answers, percentage).

•Display the final result with score and performance.

•Optionally store the result in the database for future reference.

•Display a thank-you message and logout option.

•End the program.

Importance of Algorithm in the Project

•Helps to convert real-world quiz process into structured steps.

•Ensures smooth flow from login to result generation.

•Improves accuracy in answer evaluation and score calculation.

•Acts as a blueprint for coding and debugging.

•Enhances clarity, modularity, and efficiency in system design.

4.7. Flowchart

Start

↓

Login/Register

↓

Select Quiz

↓

Answer Questions

↓

Submit Quiz

↓

Evaluate Answers

↓

Display Result

↓

End

Explanation of Flow

1.Start – The program begins execution and displays the system title.

2.User Login / Registration – The user is prompted to log in or create a new account by entering required details.

3.Validate User – The system checks the entered credentials. If valid, access is granted; otherwise, an error message is shown.

4.Display Quiz List – Available quizzes or subjects are displayed for the user to choose from.

5.Select Quiz – The user selects a quiz from the given list.

6.Load Questions – The system retrieves quiz questions and options from the database.

7.Process Each Question–

a)Displays the question with multiple-choice options.

b)Accepts the user's answer.

c)Validates the input.

d)Stores the selected answer.

8.Submit Quiz – After answering all questions, the user submits the quiz.

9.Evaluate Answers – The system compares user responses with correct answers.

10.Calculate Score – Total marks, correct answers, wrong answers, and percentage are calculated.

11.Display Result – The final result is shown to the user with score and performance details.

12.Save Result – Optionally stores the result in the database for future reference.

13.End – Displays a thank-you message and exits the program.

5. SOURCE CODE

```
 #include
int main() {

int i, answer, score = 0;

int correct_answers[5] = {2, 1, 3, 2, 1};

printf("==================================\n");

printf(" ONLINE QUIZ SYSTEM\n");

printf("==================================\n\n");

printf("Instructions:\n");

printf("Choose the correct option (1-4)\n\n");
```

```
// Question 1
printf("1. What is the capital of India?\n");
printf("1) Mumbai\n2) Delhi\n3) Chennai\n4) Kolkata\n");
printf("Enter your answer: ");
scanf("%d", &answer);
if(answer == correct_answers[0]) score++;
// Question 2
printf("\n2. Which language is used for C programming?\n");
printf("1) C\n2) Java\n3) Python\n4) HTML\n");
printf("Enter your answer: ");
scanf("%d", &answer);
if(answer == correct_answers[1]) score++;
// Question 3
printf("\n3. 2 + 2 = ?\n");
printf("1) 3\n2) 5\n3) 4\n4) 6\n");
printf("Enter your answer: ");
scanf("%d", &answer);
if(answer == correct_answers[2]) score++;
// Question 4
printf("\n4. Which is a programming language?\n");
printf("1) HTML\n2) C++\n3) CSS\n4) XML\n");
printf("Enter your answer: ");
scanf("%d", &answer);
if(answer == correct_answers[3]) score++;
// Question 5
printf("\n5. Who is known as father of computer?\n");
printf("1) Charles Babbage\n2) Einstein\n3) Newton\n4) Tesla\n");
```

```
printf("Enter your answer: ");
scanf("%d", &answer);
if(answer == correct_answers[4]) score++;
// Result
printf("\n==================================\n");
printf(" QUIZ RESULT\n");
printf("==================================\n");
printf("Total Questions: 5\n");
printf("Correct Answers: %d\n", score);
printf("Wrong Answers: %d\n", 5 - score);
printf("Score: %d / 5\n", score);
if(score == 5) {
printf("Excellent!\n");
} else if(score >= 3) {
printf("Good Job!\n");
} else {
printf("Better Luck Next Time!\n");
}
printf("\nThank you for participating!\n");
return 0;
}
```

SOURCE CODE EXPLANATION:

The Online Quiz System program is developed using the C language to display questions, collect user responses, evaluate answers, and show the final result.

1) Program Start

•The program begins execution from the main() function.

•It initializes variables and displays the quiz title.

2) Variable Declaration

```
int answer, score = 0;
int correctAnswers[5] = {2, 1, 3, 2, 1};
```

Explanation:

•answer → Stores the user's input

•score → Tracks number of correct answers

•correctAnswers[] → Stores correct options for each question

3) Print Title & Instructions

•Displays quiz title and instructions using printf().

•Helps the user understand how to answer.

4) Display Questions and Options

•Each question is shown with 4 options.

•Example:

```
printf("Who is known as father of computer?\n");
printf("1) Charles Babbage\n2) Einstein\n3) Newton\n4) Tesla\n");
```

5) Capture User Input

```
scanf("%d", &answer);
```

•Takes user input for each question.

•Stores the selected option in answer.

6) Answer Validation & Checking

```
if(answer == correctAnswers[i]) {
score++;
}
```

Explanation:

•Compares user answer with correct answer

•If correct → increases score

7) Loop for Multiple Questions

```
for(int i = 0; i < 5; i++)
```

Explanation:

•Repeats the process for all questions

•Avoids writing repetitive code

•Makes program efficient

8) Input Validation

```
if(answer < 1 || answer > 4) {
printf("Invalid choice!\n");
i--;
}
```

Explanation:

•Ensures user enters valid option (1–4)

•If invalid → repeats same question

9) Score Calculation

•Score is calculated by counting correct answers.

```
score++;
```

10) Result Display

```
printf("Score: %d / 5\n", score);
```

Explanation:

•Displays:

- •Total questions
- •Correct answers
- •Wrong answers
- •Final score

11) Performance Message

```
if(score == 5)
printf("Excellent!");
else if(score >= 3)
printf("Good Job!");
else
printf("Try Again!");
```

12) Program End

```
return 0;
```

•Ends the program successfully

Overall Working Summary

The Online Quiz System works as follows:

•Starts the program

•Displays title and instructions

•Shows questions one by one

•Accepts user answers

•Validates input

•Compares answers with correct ones

•Calculates score

•Displays result and feedback

•Ends the program

6. INPUT AND OUTPUT SCREENS

Input Screen 1:

```
==================================
      ONLINE QUIZ SYSTEM
==================================

Instructions:
Choose the correct option (1-4)
Press Enter to start the quiz...
```

Input Screen 2:

```
1. What is the capital of India?

1) Mumbai
2) Delhi
3) Chennai
4) Kolkata

Enter your answer: 2
```

Output Screen:

```
================================
      ONLINE QUIZ SYSTEM
================================

Instructions:
Choose the correct option (1-4)

1. What is the capital of India?
1) Mumbai
2) Delhi
3) Chennai
4) Kolkata
Enter your answer: 2

2. Which language is used for C programming?
1) C
2) Java
3) Python
4) HTML
Enter your answer: 1

3. 2 + 2 = ?
1) 3
2) 5
3) 4
4) 6
Enter your answer: 1

4. Which is a programming language?
1) HTML
2) C++
3) CSS
4) XML
Enter your answer: 2

5. Who is known as father of computer?
1) Charles Babbage
2) Einstein
3) Newton
4) Tesla
Enter your answer: 1

================================
        QUIZ RESULT
================================
Total Questions: 5
Correct Answers: 4
Wrong Answers: 1
Score: 4 / 5
Good Job!

Thank you for participating!

=== Code Execution Successful ===
```

7.DISCUSSION & CONCLUSION

7.1 Discussion

This project successfully automates the quiz process by:

•Using structured programming concepts such as loops, arrays, and conditional statements.

•Implementing a simple and interactive user interface for answering quiz questions.

•Automating answer evaluation and score calculation without manual effort.

•Ensuring input validation to avoid incorrect data entry.

•Demonstrating real-world application in educational environments and online assessments.

The system is efficient, easy to use, and suitable for students, institutions, and training purposes.

7.2 Conclusion

The Online Quiz System achieves its intended objectives:

•Provides a simple and effective platform for conducting quizzes.

•Demonstrates practical implementation of C programming concepts.

•Reduces time and errors compared to manual quiz systems.

•Can be easily enhanced with additional features such as:

- •User login system
- •Timer-based quizzes
- •Database storage
- •Result analysis

Overall, the project is a reliable and scalable solution for digital quiz management.
